

Consent for the usability study

This is a short verbal-consent script intended for a low-risk classroom-level usability evaluation.

What you will be asked to do

You will use a web-based dashboard for about 30 minutes and complete five short tasks. After each task you will be asked a single verifying question. The session will be observed and your spoken thoughts will be recorded as written notes.

What is recorded automatically

The dashboard uses webcam to estimate where on the screen your eyes are looking, sampled approximately 30 times per second. **The webcam video is not stored.** Only the estimated (x, y) screen coordinates, a timestamp, and the name of the currently active dashboard tab are written to a local CSV file on this laptop.

The estimated gaze accuracy after calibration is approximately 100 to 200 pixels. We will use the data only to compare which areas of the dashboard you looked at, not your exact fixation locations.

What is NOT recorded

- Your face or any biometric identifier.
- Your voice.
- Anything outside the browser window.

Confidentiality

The CSV file is stored on this laptop with a participant identifier (e.g. P02). No personal identifier is added. Only the researcher will see the file. The analysis is aggregated across participants in the project report.

Your rights

You may stop the session at any time, skip any task, or ask for the CSV file to be deleted at the end of the session without giving a reason.

Verbal consent

“Do you understand what will be recorded and do you agree to continue?”

If the participant answers yes, I proceed with calibration. If they answer no or hesitate, I stop the session.
